nabc language for gregorio

The nabc language provides the ability to describe some adiastematic neumes, for now just the St. Gallen style. The language is partially based on Dom Eugène Cardine's Table of neumatic signs, but for more complex neumes doesn't always match how the neumes are called; instead attempts to make it easier to compose complex neumes from basic glyphs. To describe adiastematic neumes in gabc, the header should contain nabc-lines: 1; line, like:

```
nabc-lines: 1;
(f3) AL(ef~|ta>)le(fg/hggf|peclhgpi)lú(ef~|ta>)ia.(f.|ta-) (,)
(ii//|bv-|gh!ivHG//|vi-hhppu2su1sut1|fhg/|to|eef.|pt) (;)
```

The nabc snippets are then separated by | character from gabc snippets or other nabc snippets. Every gabc snippet may be followed by multiple nabc snippets. The maximum number of consecutive nabc snippets is the number declared in the header field nabc-lines: x;. After reaching that number of consecutive nabc snippets another gabc snippet followed by nabc snippets can follow. A single nabc snippet is not split into multiple lines, so for larger melismatic pieces it is desirable to synchronize the gabc snippets with corresponding nabc snippets. With nabc-lines: 1; the gabc and nabc snippets form an alternating pattern, like (gabc|nabc|gabc|nabc|gabc), in this case the last gabc snippet does not have any corresponding nabc neumes. With nabc-lines: 2; the snippets ordering could be e.g. (gabc|nabc|nabc|nabc1|nabc2|gabc|nabc1).

Each nabc snippet consists of a sequence of *complex neume descriptors*. Each *complex neume descriptor* consists of optional *horizontal spacing adjustment descriptor*, then *complex glyph descriptor*, optionally followed by a sequence of *subpunctis and prepunctis descriptors*, optionally followed by a sequence of *significant letter descriptors*.

The horizontal spacing adjustment descriptor consists of a sequence of horizontal spacing adjustment characters / and `.

- // move by nabclargerspace skip to the right
- / move by nabcinterelementspace skip to the right
- `` move by nabclargerspace skip to the left
- `move by nabcinterelementspace skip to the left

The *complex glyph descriptor* consists of a *glyph descriptor*, optionally followed by a sequence of other *glyph descriptors*, all separated by the ! character. This is used to describe more complex glyphs, where certain basic glyphs are connected together. Each *glyph descriptor* consists of a *basic glyph descriptor*, followed by optional *glyph modifiers*, followed by optional *pitch descriptor*.

Each glyph descriptor consists of a basic glyph descriptor, followed by optional glyph modifiers, followed by optional pitch descriptor. The basic glyph descriptor is a two-letter string from the following table:

```
tr v torculus resupinus | tv /// trivirga
vi / virga
                         po № porrectus
                                                                                                        pq 🗸 pes quassus

pe / pes
```

The glyph modifiers is a possibly empty sequence of following characters optionally followed by a number:

- S modification of the mark
- G modification of the grouping (neumatic break)
- M melodic modification
- addition of episema
- > augmentive liquescence
- ~ diminutive liquescence

If Dom Cardine's table contains multiple glyphs with the same modifiers, a positive number is added afterwards. E.g. for augmentive liquescent clivis the table shows two different glyphs, the ancus cl> o and then another neume - cl>1 o, the first neume does not contain any number after it, while the 1 indicates first variant.

The pitch descriptor allows to specify the vertical position of the neume. There are no staves, so the vertical position is only rough. For pitches the same letters as in gabe are used, a through m. If the pitch descriptor is missing, the default is hf, otherwise it consists of the letter h followed by the pitch letter. Within the complex glyph descriptor, each basic glyph descriptor has its own pitch, but in the current fonts there are no glyphs with different relative pitches, so if you use a pitch descriptor on any of the basic glyph descriptors in the complex glyph descriptor, it is best to use the same one on all the other basic glyph descriptors in the same complex glyph descriptor. The subpunctis and prepunctis descriptor consists of the letters su for subpunctis or pp for prepunctis, followed optionally by a modifier letter from the following table and finally a mandatory positive number of repetitions. If the modifier letter is missing, it is a punctum.

- t tractulus
- u , tractulus with episema
- v _ tractulus with double episema

- w gravis
- x, liquescens stropha
- y gravis with episema

Only subpunctis are normally used in neume classification, the prepunctis is a nabc concept to describe the rising sequence of punctis, tractulis etc. in the left low corner of some neume. While e.g. vipp2 describes the same neume as sc , the former form allows better control on how many punctis or tractulis or tractulis with episema etc. there are. Some examples: ppt3 stands for 3 raising tractulis with episema, while su1sut1sux1 stands for a punctum, followed by tractulus, followed by liquescens stropha.

The *significant letter descriptor* consists of the letters 1s, followed by a shorthand of the significant letter or common group of them, followed by a number - a rough position relative to the *complex glyph descriptor* glyph with prepunctis and subpunctis attached to it. If more than one *significant letter descriptor* is used on the same *complex neume descriptors* for the same position, then they are ordered in the order they are written in the nabc snippet at that position. The position numbers are:

1 °/ left upper corner2 °/ above the neume3 °/ right upper corner4 °/ to the left of the neume6 °/ to the right of the neume7 °/ left bottom corner8 °/ below the neume9 °/ right bottom corner

The shorthands, including the 1s prefix, which should be followed by the above mentioned position digit:

Finally a commented example of a nabc snippet:

```
```po////pe>2lse7lsl3qlhh!vshhppt1sut2ql>ppu3
```

س \_ المار ساء ساء

stands for a negative horizontal skip (move to the left) by nabcinterelementspace and nabclargerspace.

po *№* is a basic porrectus, at the default pitch (height hf).

//// stands for a horizontal skip (move to the right) by two times nabclargerspace.

pe>21se71s13 \_\_\_\_ stands for the 3rd augmentive liquescent form of podatus (epiphonus with tractulus, see the following page) at the default pitch, with equaliter in the low left corner and levare in the upper right corner.

qlhh!vshhppt1sut2 • stands for a 3 loop quilisma joined with virga strata, both at relative pitch 2 above the default one, with a single tractulus before it and two subpunctis - tractulis.

q1>ppu3 نام is a 3 loop liquescent quilisma with 3 tractulis with episema before it.

# manuscript sources of the gregall font

The list of glyphs uses following abbreviations for manuscript references; the page number is always for the start of some antiphon, responsory, mass propers, even when the actual neume is on a later page. At the end of lines, GT stands for Graduale Triplex, Solesmes, 1979, OT for Offertoriale Triplex, Solesmes, 1985, AM for Antiphonale Monasticum, Solesmes, 1934, ARII for Antiphonale Romanum II, Solesmes, 2009 and NR for Nocturnale Romanum, Hartker Verlag, 2002, followed by page number which also contains the corresponding propers, antiphons or responsories.

Most of the glyphs taken from the e-codices Virtual Manuscript Library of Switzerland, http://www.e-codices.unifr.ch/en, with permission from Stiftsbibliothek, St. Gallen http://www.stibi.ch/ and Stiftsbibliothek, Einsiedeln http://kloster-einsiedeln.ch/, the picture fragments from there are only present in the font source file to help drawing the glyphs.

# Cantatorium codex 359
